## **SCE\_FIOS\_CHUNK\_STORAGE\_SIZE**

---

Size required for the [SceFiosParams](#).*chunkStorage* buffer.

### **Definition**

---

```
#include <fios2_types.h>
#define SCE_FIOS_CHUNK_STORAGE_SIZE(
    numChunks
) SCE_FIOS_STORAGE_SIZE(numChunks, SCE_FIOS_CHUNK_SIZE)
```

### **Arguments**

---

[in] *numChunks*     Minimum number of chunks required.

### **Description**

---

Size required for the [SceFiosParams](#).*chunkStorage* buffer. The size of each chunk varies, so SCE\_FIOS\_STORAGE\_SIZE returns an approximate size required based on *numChunks*.

## SCE\_FIOS\_RAM\_CACHE\_BUFFER\_SIZE\_PER\_BLOCK

---

Macro to determine size of the work buffer for [SceFiosRamCacheContext](#) given a block size and block count.

### Definition

---

```
#include <fios2_filters.h>
#define SCE_FIOS_RAM_CACHE_BUFFER_SIZE_PER_BLOCK(
    blocks,
    blocksize,
    pathMax
) ((blocks * (blocksize + 64)) + SCE_FIOS_ALIGN_UP((72 + pathMax + 1), 8))
```

### Arguments

---

|                       |   |
|-----------------------|---|
| [in] <i>blocks</i>    | Number of cache blocks desired.   |
| [in] <i>blocksize</i> | Size in bytes of each cache block.  |
| [in] <i>pathMax</i>   | Value of <a href="#">SceFiosParams</a> . <i>pathMax</i> , or SCE_FIOS_PATH_DEFAULT, or SCE_FIOS_PATH_MAX. |

### Description

#include <fios2_api.h>
#define sceFiosTimeIntervalFromMicroseconds (
    us
) sceFiosTimeIntervalFromNanoseconds ((us) *
SCE_FIOS_NANOSECONDS_PER_MICROSECOND)
```

### Arguments

---

[in] *us*      Microseconds to convert.

### Description

---

Converts microseconds to a [SceFiosTimeInterval](#).

### Notes

---

Result is the equivalent [SceFiosTimeInterval](#).

SCE CONFIDENTIAL

```
#include <fios2_api.h>
#define sceFiosTimeIntervalFromMilliseconds (
    ms
) sceFiosTimeIntervalFromNanoseconds (ms) *
SCE_FIOS_NANOSECONDS_PER_MILLISECOND)
```

### Arguments

---

[in] *ms*      Milliseconds to convert.

### Description

---

Converts milliseconds to a [SceFiosTimeInterval](#).

### Notes

---

Result is the equivalent [SceFiosTimeInterval](#).

SCE CONFIDENTIAL

) SCE_FIOS_DIVIDE_ROUNDING_UP(sceFiosTimeIntervalToNanoseconds(interval),
    SCE_FIOS_NANOSECONDS_PER_MICROSECOND)
```

### Arguments

---

[in] *interval* Interval to convert.

### Description

---

Converts a [SceFiosTimeInterval](#) to microseconds.

### Notes

---

The result is rounded upward, so an interval representing 1.5 microseconds will return the value 2.  
Result is the equivalent number of microseconds.

SCE CONFIDENTIAL

    interval
) SCE_FIOS_DIVIDE_ROUNDING_UP(sceFiosTimeIntervalToNanoseconds(interval),
    SCE_FIOS_NANOSECONDS_PER_MILLISECOND)
```

### Arguments

---

[in] *interval* Interval to convert.

### Description

---

Converts a [SceFiosTimeInterval](#) to milliseconds.

### Notes

---

The result is rounded upward, so an interval representing 1.5 milliseconds will return the value 2.  
Result is the equivalent number of milliseconds.

SCE CONFIDENTIAL

    interval
) SCE_FIOS_DIVIDE_ROUNDING_UP(sceFiosTimeIntervalToNanoseconds(interval),
    SCE_FIOS_NANOSECONDS_PER_SECOND)
```

### Arguments

---

[in] *interval* Interval to convert.

### Description

---

Converts a [SceFiosTimeInterval](#) to seconds.

### Notes

---

The result is rounded upward, so an interval representing 1.5 seconds will return the value 2.  
Result is the equivalent number of seconds.

) ((sceFiosTimeGetCurrent() - start) > timeout)
```

### Arguments

---

[in] *start*      The starting point.  
[in] *timeout*    The timeout interval.

### Description

---

Checks for a timeout condition. Returns true if the timeout interval has elapsed.

SCE CONFIDENTIAL

---

## sceFiosTimeRelativeMicroseconds

---

Returns a [SceFiosTime](#) representing a number of microseconds from now.

### Definition

---

```
#include <fios2_api.h>
#define sceFiosTimeRelativeMicroseconds (
    us
) (sceFiosTimeGetCurrent() + sceFiosTimeIntervalFromMicroseconds(us))
```

### Arguments

---

[in] *us* Microseconds from now.

### Description

---

Returns a [SceFiosTime](#) representing a number of microseconds from now.

### Notes

---

Result is the equivalent [SceFiosTime](#).

SCE CONFIDENTIAL

### Arguments

---

[in] *ns* Nanoseconds from now.

### Description

---

Returns a [SceFiosTime](#) representing a number of nanoseconds from now.

### Notes

---

Result is the equivalent [SceFiosTime](#).

SCE CONFIDENTIAL

# sceFiosArchiveGetMountBufferSize

Gets the size of the memory buffer required to mount an archive.

## Definition

```
#include <fios2_api.h>
SceFiosOp sceFiosArchiveGetMountBufferSize (
    const SceFiosOpAttr *pAttr,
    const char *pArchivePath,
    const SceFiosOpenParams *pOpenParams
);
```

## Arguments

|                          |   |
|--------------------------|---|
| [in] <i>pAttr</i>        | Operation attributes. May be NULL.  |
| [in] <i>pArchivePath</i> | Path to an archive to query.  |
| [in] <i>pOpenParams</i>  | Open parameters. May be NULL, in which case the file will be opened with normal read-only permission. |

## Return Values

Operation handle. Caller is responsible for deleting this handle with [sceFiosOpDelete\(\)](#).

## Description

Gets the size of the memory buffer required to mount an archive. This function will typically open the archive file, read the header, and close the file again. Upon completion, the mount buffer size will be returned via [sceFiosOpGetActualCount\(\)](#).

## Notes

A dearchiver must be present in the I/O filter stack for this function to succeed.

## Arguments

|                          |   |
|--------------------------|---|
| [in] <i>pAttr</i>        | Operation attributes. May be NULL.  |
| [in] <i>pArchivePath</i> | Path to an archive to query.  |
| [in] <i>pOpenParams</i>  | Open parameters. May be NULL, in which case the file will be opened with normal read-only permission. |

## Return Values

Non-negative values are the required mount buffer size. Negative values are error codes.

## Description

Gets the size of the memory buffer required to mount an archive (sync). This function typically opens the archive file, reads the header, and closes the file again.

## Notes

A dearchiver must be present in the I/O filter stack for this function to succeed.

## Arguments

|                          |   |
|--------------------------|---|
| [in] <i>pAttr</i>        | Operation attributes. May be NULL.  |
| [out] <i>pOutFH</i>      | Returns a file handle to the archive, which can be used to unmount it later.                          |
| [in] <i>pArchivePath</i> | Path to an archive to mount.  |
| [in] <i>pMountPoint</i>  | Mount point where the archive's contents will appear.   |
| [in] <i>mountBuffer</i>  | Buffer to hold archive TOC and related data. This will be used until the archive is unmounted.        |
| [in] <i>pOpenParams</i>  | Open parameters. May be NULL, in which case the file will be opened with normal read-only permission. |

## Return Values

Operation handle. Caller is responsible for deleting this handle with [sceFiosOpDelete\(\)](#).

## Description

Mounts an archive. After an archive is mounted, its contents will be available at the mount point. Memory space is required to mount most archives. If you don't pass in a sufficient amount of memory in *mountBuffer* the request will fail with `SCE_FIOS_ERROR_BAD_SIZE`. Whether the mount succeeds or fails, the actual amount of memory required to mount the archive will be returned via [sceFiosOpGetActualCount\(\)](#) if it can be determined.

## Notes

A dearchiver must be present in the I/O filter stack for this function to succeed. See the *libfios2 Overview* document for information about how conflicts are resolved when multiple archives are mounted.

| [in] <i>pOpenParams</i>  | Open parameters. May be NULL, in which case the file will be opened with normal read-only permission. |

## Return Values

SCE\_FIOS\_OK for success, SCE\_FIOS\_ERROR\_BAD\_SIZE if *mountBuffer* was too small, or an error code.

## Description

Mounts an archive (sync). After an archive is mounted, its contents will be available at the mount point.

Memory space is required to mount most archives. If you don't pass in a sufficient amount of memory in *mountBuffer* the request will fail with SCE\_FIOS\_ERROR\_BAD\_SIZE. ## Definition

---

```
#include <fios2_api.h>
uint8_t sceFiosArchiveSetDecompressorThreadCount(

## Arguments

---

[in] *threadCount*      Number of threads to use. If this value is 0, one thread will be used. If this value is greater than *maxDecompressorThreadCount*, *maxDecompressorThreadCount* will be used.

## Return Values

## Description

---

Set the number of decompression threads to use. When a dearchiver filter is first added, it will create the number of threads specified in [SceFiosParams](#).*maxDecompressorThreadCount*. ```
#include <fios2_api.h>
int sceFiosCacheContainsFileRangeSync (
    const char *pPath,
    SceFiosOffset offset,
    SceFiosSize length
);
```

### Arguments

---

|                    |                                       |
|--------------------|---------------------------------------|
| [in] <i>pPath</i>  | Path to file to query.                |
| [in] <i>offset</i> | Offset within file to query.          |
| [in] <i>length</i> | Number of bytes within file to query. |

### Return Values

---

Returns `SCE_FIOS_ERROR_BAD_INDEX` if any of the range is not cached. Otherwise, it returns the filter index of the cache containing the data.

### Description

---

Because of the dynamic nature of the cache, the answer could change as more I/O is issued. It is possible that this function could return true and yet the data could be evicted by the time you try to read it, or vice-versa.

```

### Arguments

---

|                       |   |
|-----------------------|---|
| [in] <i>pPath</i>     | Path to file to query.                                |
| [out] <i>pOutSize</i> | On success, filled with the file's size. May be NULL. |

### Return Values

---

Returns `SCE_FIOS_ERROR_BAD_INDEX` if any of the file is not cached. Otherwise, it returns the filter index of the cache containing the data.

### Description

---

Indicates whether FIOS's data caches contain all of a given file.

### Notes

|--------------------|---|
| [in] <i>pPath</i>  | File to flush.                            |
| [in] <i>offset</i> | Offset within the file to flush.          |
| [in] <i>length</i> | Number of bytes from the offset to flush. |

### Return Values

## sceFiosDateFromComponents

---

Converts a struct `tm` into a [SceFiosDate](#).

### Definition

---

```
#include <fios2_api.h>
SceFiosDate sceFiosDateFromComponents (
    const struct tm *pComponents
);
```

### Arguments

---

[in] `pComponents`      Pointer to a struct `tm`.

### Return Values

---

An equivalent date, or 0 if the date could not be represented.

### Description

---

Converts a struct `tm` into a [SceFiosDate](#).

### Notes

---

The `tm_wday`, `tm_yday` and `tm_isdst` fields in `pComponents` are ignored. In addition, the original values of the other components are not restricted to their normal ranges, and are normalized as needed. Examples: October 40 is changed to November 9, a `tm_hour` of -1 means 1 hour before midnight, `tm_mday` of 0 means the day preceding the current month, and `tm_mon` of -2 means 2 months before January of `tm_year`. See `time.h` for a description of struct `tm`.

## sceFiosDateFromFILETIME

---

Converts a FILETIME into a [SceFiosDate](#).

### Definition

---

```
#include <fios2_api.h>
SceFiosDate sceFiosDateFromFILETIME (
    const FILETIME *ft
);
```

### Arguments

---

[in] *ft* FILETIME to convert.

### Return Values

---

The equivalent [SceFiosDate](#), or 0 if the date could not be represented.

### Description

---

Converts a FILETIME into a [SceFiosDate](#). Available only on Windows.

### Notes

---

For information about FILETIME, see WinDef.h (in \Program Files (x86)\Microsoft SDKs\Windows\v7.0A\Include).

### Definition

---

```
#include <fios2_api.h>
SceFiosDate sceFiosDateFromSceDateTime (
    const SceDateTime *pSceDateTime
);
```

### Arguments

---

[in] `pSceDateTime`    Pointer to a `SceDateTime`.

### Return Values

---

The equivalent [SceFiosDate](#), or 0 if the date could not be represented.

### Description

---

Converts a `SceDateTime` (see the *libscebase Reference*) into a [SceFiosDate](#). Available only on PlayStation®Vita.

# sceFiosDateToComponents

---

Converts a [SceFiosDate](#) into a struct `tm`.

## Definition

---

```
#include <fios2_api.h>
struct tm *sceFiosDateToComponents(
    SceFiosDate date,
    struct tm *pOutComponents
);
```

## Arguments

---

|                             |                                     |
|-----------------------------|-------------------------------------|
| [in] <i>date</i>            | Date to convert.                    |
| [out] <i>pOutComponents</i> | Filled in with the date components. |

## Return Values

---

The result is always equal to *pOutComponents*.

## Description

---

Converts a [SceFiosDate](#) into a struct `tm`.

## Notes

---

The *tm\_wday*, *tm\_yday* and *tm\_isdst* fields in *pOutComponents* are not updated. See `time.h` for a description of struct `tm`.

### Definition

---

```
#include <fios2_api.h>
SceDateTime *sceFiosDateToSceDateTime (
    SceFiosDate date,
    SceDateTime *pSceDateTime
);
```

### Arguments

---

|                                 |  |
|---------------------------------|--|
| [in] <code>date</code>          | <a href="#">SceFiosDate</a> to convert.        |
| [out] <code>pSceDateTime</code> | Filled with the result for the converted date. |

### Return Values

---

The result is always equal to `pSceDateTime`.

### Description

---

Converts a [SceFiosDate](#) into a `SceDateTime` (see the *libscebase Reference*). Available only on PlayStation®Vita.

---

## sceFiosDebugDumpDate

---

Creates a human-readable debug description of a `SceFiosDate`.

### Definition

---

```
#include <fios2_debug.h>
char *sceFiosDebugDumpDate (
    SceFiosDate date,
    char *pBuffer,
    size_t bufferSize
);
```

### Arguments

---

|                        |  |
|------------------------|--|
| [in] <i>date</i>       | Date to dump.  |
| [in] <i>pBuffer</i>    | Buffer to receive the dump. May be NULL.   |
| [in] <i>bufferSize</i> | Size of the buffer. For best results, the buffer should be at least 48 characters. |

### Return Values

---

If *pBuffer* was non-NULL, it is returned. Otherwise an internal global buffer is returned.

### Description

---

Creates a human-readable debug description of a `SceFiosDate`.

---

## sceFiosDebugDumpDH

---

Creates a human-readable debug description showing the details of a directory handle.

### Definition

---

```
#include <fios2_debug.h>
char *sceFiosDebugDumpDH (
    SceFiosDH dh,
    char *pBuffer,
    size_t bufferSize
);
```

### Arguments

---

|                        |  |
|------------------------|--|
| [in] <i>dh</i>         | Directory handle to dump.  |
| [in] <i>pBuffer</i>    | Buffer to receive the dump. May be NULL.   |
| [in] <i>bufferSize</i> | Size of the buffer. For best results, the buffer should be least 512 characters. |

### Return Values

---

If *pBuffer* was non-NULL, it is returned. Otherwise an internal global buffer is returned.

### Description

---

Creates a human-readable debug description showing the details of a directory handle.

---

## sceFiosDebugDumpError

---

Creates a human-readable debug description of an error returned by FIOS.

### Definition

---

```
#include <fios2_debug.h>
char *sceFiosDebugDumpError(
    int err,
    char *pBuffer,
    size_t bufferSize
);
```

### Arguments

---

|                        |   |
|------------------------|---|
| [in] <i>err</i>        | Error code.   |
| [in] <i>pBuffer</i>    | Buffer to receive the error string. May be NULL.                                |
| [in] <i>bufferSize</i> | Size of the buffer. For best results, the buffer should be least 48 characters. |

### Return Values

```

### Arguments

---

|                        |  |
|------------------------|--|
| [in] <i>fh</i>         | File handle to dump.   |
| [in] <i>pBuffer</i>    | Buffer to receive the dump. May be NULL.   |
| [in] <i>bufferSize</i> | Size of the buffer. For best results, the buffer should be least 512 characters. |

### Return Values

---

If *pBuffer* was non-NULL, it is returned. Otherwise an internal global buffer is returned.

### Description

---

Creates a human-readable debug description showing the details of a file handle.

---

## sceFiosDebugDumpOp

---

Creates a human-readable debug description showing the details of an op handle.

### Definition

---

```
#include <fios2_debug.h>
char *sceFiosDebugDumpOp (
    SceFiosOp op,
    char *pBuffer,
    size_t bufferSize

```

### Arguments

---

|                        |  |
|------------------------|--|
| [in] <i>op</i>         | Operation to dump.   |
| [in] <i>pBuffer</i>    | Buffer to receive the dump. May be NULL.   |
| [in] <i>bufferSize</i> | Size of the buffer. For best results, the buffer should be least 512 characters. |

### Return Values

---

If *pBuffer* was non-NULL, it is returned. Otherwise an internal global buffer is returned.

### Description

---

Creates a human-readable debug description showing the details of an op handle.

# sceFiosFHPwritevSync

Writes bytes to a file, at a specified offset, with multiple source buffers (sync).

## Definition

```
#include <fios2_api.h>
SceFiosSize sceFiosFHPwritevSync (
    const SceFiosOpAttr *pAttr,
    SceFiosFH fh,
    const SceFiosBuffer iov[],
    int iovcnt,
    SceFiosOffset offset
);
```

## Arguments

|                    |   |
|--------------------|---|
| [in] <i>pAttr</i>  | Operation attributes. May be NULL.                                  |
| [in] <i>fh</i>     | File handle.  |
| [in] <i>iov</i>    | Array of buffer descriptors containing file data to write.          |
| [in] <i>iovcnt</i> | Size of the <i>iov</i> array. The maximum size for this array is 8. |
| [in] <i>offset</i> | Offset to write to.   |

## Return Values

Non-negative values are the number of bytes written;  $0 \leq \text{result} \leq (\text{sum of iov length values})$ .  
Negative values are error codes.

## Description

Writes bytes to a file, at a specified offset, with multiple source buffers (sync).

## Notes

This call does not use or modify the file handle's internal file position.

| [in] <i>pBuf</i>   | Buffer to receive file data.       |
| [in] <i>length</i> | Requested number of bytes to read. |

## Return Values

---

Operation handle. Caller is responsible for deleting this handle with [sceFiosOpDelete\(\)](#).

## Description

---

Reads bytes from a file.

## Notes

---

This call uses and modifies the file handle's internal file position, but does not update it until after the operation completes. Thus, issuing multiple calls to this function at the same time for the same file handle could lead to unexpected results; to avoid this problem, use [sceFiosFHPreRead\(\)](#).

| [in] <i>pBuf</i>   | Buffer to receive file data.       |
| [in] <i>length</i> | Requested number of bytes to read. |

## Return Values

---

Non-negative values are the number of bytes read;  $0 \leq \text{result} \leq \text{length}$ . Negative values are error codes. Return of zero indicates a read offset starting at or after the end-of-file.

## Description

---

Reads bytes from a file (sync).

## Notes

---

This call uses and modifies the file handle's internal file position, but does not update it until after the operation completes. Thus, issuing multiple calls to this function from multiple threads at the same time for the same file handle could lead to unexpected results; to avoid this problem, use [sceFiosFHPreReadSync\(\)](#).

| [in] <i>pBuf</i>   | Buffer to receive file data.         |
| [in] <i>length</i> | Requested number of bytes to read.   |
| [in] <i>offset</i> | Offset within the file to read from. |

## Return Values

---

Operation handle. Caller is responsible for deleting this handle with [sceFiosOpDelete\(\)](#).

## Description

---

Reads bytes from a file without opening it first. This call is equivalent to [sceFiosFHOpen\(\)](#), followed by [sceFiosFHPread\(\)](#), followed by [sceFiosFHClose\(\)](#).

# sceFiosFileReadSync

Reads bytes from a file without opening it first (sync).

## Definition

```
#include <fios2_api.h>
SceFiosSize sceFiosFileReadSync (
    const SceFiosOpAttr *pAttr,
    const char *pPath,
    void *pBuf,
    SceFiosSize length,
    SceFiosOffset offset
);
```

## Arguments

|                    |                                      |
|--------------------|--------------------------------------|
| [in] <i>pAttr</i>  | Operation attributes. May be NULL.   |
| [in] <i>pPath</i>  | Path to a file to read.              |
| [in] <i>pBuf</i>   | Buffer to receive file data.         |
| [in] <i>length</i> | Requested number of bytes to read.   |
| [in] <i>offset</i> | Offset within the file to read from. |

## Return Values

Non-negative values are the number of bytes read;  $0 \leq \text{result} \leq \text{length}$ . Negative values are error codes. Return of zero indicates a read offset starting at or after the end-of-file.

## Description

Reads bytes from a file without opening it first (sync). This call is equivalent to [sceFiosFHOpen\(\)](#), followed by [sceFiosFHPread\(\)](#), followed by [sceFiosFHClose\(\)](#).

## sceFiosFileTruncateSync

---

Resizes a file without opening it first (sync).

### Definition

---

```
#include <fios2_api.h>
int sceFiosFileTruncateSync(
    const SceFiosOpAttr *pAttr,
    const char *pPath,
    SceFiosSize length

```

### Arguments

---

|                    |                                    |
|--------------------|------------------------------------|
| [in] <i>pAttr</i>  | Operation attributes. May be NULL. |
| [in] <i>pPath</i>  | Path to a file to resize.          |
| [in] <i>length</i> | New file size.                     |

### Return Values

---

SCE\_FIOS\_OK for success, or an error code.

### Description

---

Resizes a file without opening it first (sync).

# sceFiosFileWrite

Writes bytes to a file without opening it first.

## Definition

```
#include <fios2_api.h>

);
```

## Arguments

|                    |                                     |
|--------------------|-------------------------------------|
| [in] <i>pAttr</i>  | Operation attributes. May be NULL.  |
| [in] <i>pPath</i>  | Path to a file to write.            |
| [in] <i>pBuf</i>   | Buffer with file data to write.     |
| [in] <i>length</i> | Requested number of bytes to write. |
| [in] <i>offset</i> | Offset within the file to write to. |

## Return Values

Operation handle. Caller is responsible for deleting this handle with [sceFiosOpDelete\(\)](#).

## Description

Writes bytes to a file without opening it first. This call is equivalent to [sceFiosFHOpen\(\)](#), followed by [sceFiosFHPwrite\(\)](#), followed by [sceFiosFHClose\(\)](#). As with a normal write, this call will overwrite bytes within the file until the end of the file is reached. Once the end of the file is reached any remaining data is appended.

| [in] <i>pBuf</i>   | Buffer with file data to write.     |
| [in] <i>length</i> | Requested number of bytes to write. |
| [in] <i>offset</i> | Offset within the file to write to. |

## Return Values

---

Non-negative values are the number of bytes written;  $0 \leq \text{result} \leq \text{length}$ . Negative values are error codes.

## Description

---

Writes bytes to a file without opening it first (sync). This call is equivalent to [sceFiosFHOpen\(\)](#), followed by [sceFiosFHPwrite\(\)](#), followed by [sceFiosFHClose\(\)](#). ## sceFiosGetAllDHs

---

Returns an array of all directory handles.

### Definition

---

```
#include <fios2_api.h>
size_t sceFiosGetAllDHs(
    SceFiosDH *pOutArray,
    size_t arraySize
);
```

### Arguments

---

|                        |   |
|------------------------|---|
| [out] <i>pOutArray</i> | Array to receive directory handles. May be NULL.                          |
| [in] <i>arraySize</i>  | Number of directory handles that will fit in <i>pOutArray</i> . May be 0. |

### Return Values

---

The actual number of directory handles that are open.

### Description

---

Returns an array of all directory handles. If the array is larger than required, the unused portion is cleared to 0.

SCE CONFIDENTIAL

---

## sceFiosGetAllFHs

---

Returns an array of all file handles.

### Definition

```
#include <fios2_api.h>

    size_t arraySize
);
```

### Arguments

|                        |  |
|------------------------|--|
| [out] <i>pOutArray</i> | Array to receive file handles. May be NULL.                          |
| [in] <i>arraySize</i>  | Number of file handles that will fit in <i>pOutArray</i> . May be 0. |

### Return Values

    size_t arraySize
);
```

### Arguments

---

|                        |  |
|------------------------|--|
| [out] <i>pOutArray</i> | Array to receive operations. May be NULL.                          |
| [in] <i>arraySize</i>  | Number of operations that will fit in <i>pOutArray</i> . May be 0. |

### Return Values

---

The total number of outstanding operations.

### Description

---

Returns an array of the outstanding operations. If the array is larger than required, the unused portion is cleared to 0.

SCE CONFIDENTIAL

---

## sceFiosGetDefaultOpAttr

---

Gets the default operation attributes.

### Definition

---

```
#include <fios2_api.h>
void sceFiosGetDefaultOpAttr(
    SceFiosOpAttr *pOutAttr
);
```

### Arguments

---

[out] *pOutAttr*      Returned operation attributes.

### Return Values

---

None

### Description

---

This returns the default operation attributes that will be used for APIs on the current thread. It takes into account both global default attribute settings, and thread-local default attribute settings (when applicable).

SCE CONFIDENTIAL

---

## sceFiosGetGlobalDefaultOpAttr

---

Gets the global default operation attributes.

### Definition

```
#include <fios2_api.h>
bool sceFiosGetGlobalDefaultOpAttr(
    SceFiosOpAttr *pOutAttr
);
```

### Arguments

[out] *pOutAttr*      Returned operation attributes.

### Return Values

| Value | Description  |
|-------|--|
| false | Global operation attributes match <code>SCE_FIOS_OPATTR_INITIALIZER</code> . |
| true  | Global operation attributes have been changed to non-default values.         |

### Description

This gets any default operation attributes previously set by [sceFiosSetGlobalDefaultOpAttr\(\)](#). If no default operation attributes have been set, it returns operation attributes that match `SCE_FIOS_OPATTR_INITIALIZER`.

## sceFiosGetSuspendCount

---

Returns FIOS's current suspend count.

### Definition

---

```
#include <fios2_api.h>
uint32_t sceFiosGetSuspendCount ();
```

### Arguments

---

None

### Return Values

---

The current suspend count.

### Description

---

Returns FIOS's current suspend count. The suspend count indicates how many times FIOS has been suspended. Upon initialization, FIOS's suspend count is zero. This value is only modified by calls to [sceFiosSuspend\(\)](#) and [sceFiosResume\(\)](#), which should be equally balanced.

SCE CONFIDENTIAL

## sceFiosGetThreadDefaultOpAttr

---

Gets the thread-local default operation attributes.

### Definition

```
#include <fios2_api.h>
bool sceFiosGetThreadDefaultOpAttr(
    SceFiosOpAttr *pOutAttr
);
```

### Arguments

[out] *pOutAttr* Returned operation attributes.

### Return Values

| Value | Description  |
|-------|--|
| false | Thread-local operation attributes match <code>SCE_FIOS_OPATTR_INITIALIZER</code> . |
| true  | Thread-local operation attributes have been changed to non-default values.         |

### Description

This gets any default operation attributes previously set by [sceFiosSetThreadDefaultOpAttr\(\)](#). If no default operation attributes have been set, it returns operation attributes that match `SCE_FIOS_OPATTR_INITIALIZER`.

### Notes

Because this function relies on thread-local storage in the compiler, it is not available on all platforms and compilers.

# sceFiosInitialize

Initializes FIOS.

## Definition

```
#include <fios2_api.h>
int sceFiosInitialize(
    const SceFiosParams *pParameters
);
```

## Arguments

[in] *pParameters* A list of parameters for FIOS initialization.

## Return Values

| Value                                     | Description  |
|---|--|
| <code>SCE_FIOS_OK</code>                  | Success.   |
| <code>SCE_FIOS_ERROR_BAD_PTR</code>       | NULL pointer passed for one of the required storage buffers.   |
| <code>SCE_FIOS_ERROR_BAD_ALIGNMENT</code> | Insufficient alignment passed for one of the required storage buffers.   |
| <code>SCE_FIOS_ERROR_BAD_SIZE</code>      | Bad <code>paramsSize</code> , or a bad size (too large or too small) was passed for one of the required storage buffers. |

## Description

The contents of the param struct are copied to a global inside FIOS, so it doesn't need to be persistent. However, any objects, buffers, or callbacks referenced by the struct must persist for the lifetime of FIOS.

You should always initialize FIOS2. However, system software might use some synchronous FIOS2 API functions before calling [sceFiosInitialize\(\)](#). In this case, the returned error codes might differ from those returned after FIOS2 is initialized. Asynchronous API functions will return [SCE\\_FIOS\\_OP\\_INVALID](#) if called before [sceFiosInitialize\(\)](#).

## Notes

Use [SCE\\_FIOS\\_PARAMS\\_INITIALIZER](#) to initialize FIOS *pParameters* with default values. Then, you must provide valid values for the following parameters: *opStorage*, *fhStorage*, *dhStorage*, and *chunkStorage*. The following list describes the specific usage for each of the [SceFiosParams](#) initialization parameters:

- *initialized* – Set by FIOS and used only by [sceFiosIsInitialized\(\)](#).
- *paramsSize* – Must be set to `sizeof(SceFiosParams)`.
- *pathMax* – If set to 0, FIOS uses [SCE\\_FIOS\\_PATH\\_DEFAULT](#). If greater than [SCE\\_FIOS\\_PATH\\_MAX](#), FIOS uses [SCE\\_FIOS\\_PATH\\_MAX](#).
- *profiling* – Must be set to a valid profiling value; see [SceFiosProfilingMask](#).
- *ioThreadCount* – If less than [SCE\\_FIOS\\_IO\\_THREAD\\_COUNT\\_MIN](#), FIOS uses [SCE\\_FIOS\\_IO\\_THREAD\\_COUNT\\_MIN](#). If greater than [SCE\\_FIOS\\_IO\\_THREAD\\_COUNT\\_MAX](#), FIOS uses [SCE\\_FIOS\\_IO\\_THREAD\\_COUNT\\_MAX](#).
- *threadsPerScheduler* – If less than [SCE\\_FIOS\\_SCHEDULER\\_THREAD\\_COUNT\\_MIN](#), FIOS uses [SCE\\_FIOS\\_SCHEDULER\\_THREAD\\_COUNT\\_MIN](#). If greater than [SCE\\_FIOS\\_SCHEDULER\\_THREAD\\_COUNT\\_MAX](#), FIOS uses [SCE\\_FIOS\\_SCHEDULER\\_THREAD\\_COUNT\\_MAX](#).

©SCEI

- *extraFlags* – Must be set to zero (0).
- *maxChunk* – If 0, FIOS uses [SCE\\_FIOS\\_CHUNK\\_DEFAULT](#).
- *maxDecompressorThreadCount* – If equal to zero, FIOS uses [SCE\\_FIOS\\_DECOMPRESSOR\\_THREAD\\_COUNT\\_DEFAULT](#). If greater than [SCE\\_FIOS\\_DECOMPRESSOR\\_THREAD\\_COUNT\\_MAX](#), FIOS uses [SCE\\_FIOS\\_DECOMPRESSOR\\_THREAD\\_COUNT\\_MAX](#).
- *reserved1* – Must be set to zero (0).
- *reserved2* – Must be set to zero (0).
- *reserved3* – Must be set to zero (0).
- *reserved4* – Must be set to zero (0).
- *reserved5* – Must be set to zero (0).
- *opStorage* – Must be set to a size of greater than  $384 + pathMax$  bytes, but less than 512KiB. Must use an alignment that is a multiple of [SCE\\_FIOS\\_OP\\_STORAGE\\_ALIGNMENT](#).
- *fhStorage* – Must be set to a size of greater than  $128 + pathMax$  bytes, but less than 512KiB. Must use an alignment that is a multiple of [SCE\\_FIOS\\_FH\\_STORAGE\\_ALIGNMENT](#).
- *dhStorage* – Must be set to a size of greater than  $128 + pathMax$  bytes, but less than 512KiB. Must use an alignment that is a multiple of [SCE\\_FIOS\\_DH\\_STORAGE\\_ALIGNMENT](#).
- *chunkStorage* – Should be at least [SCE\\_FIOS\\_CHUNK\\_DEFAULT](#) bytes, but less than [SCE\\_FIOS\\_CHUNK\\_STORAGE\\_SIZE\\_MAX](#) bytes. Must use an alignment that is a multiple of [SCE\\_FIOS\\_CHUNK\\_STORAGE\\_ALIGNMENT](#).
- *pVprintf* – If NULL, FIOS uses the platform's default `vprintf` function. Otherwise, must be a valid pointer to a replacement `vprintf` function.
- *pMemcpy* – Must be set to NULL. Note that this initialization value is not currently used.
- *reserved6* – Must be set to zero (0).
- *threadPriority* – Must be set to a valid thread priority value.
- *threadAffinity* – Must be set to a valid thread affinity value.

# sceFiosIOFilterAdd

Instantiates a new I/O filter.

## Definition

```
#include <fios2_filters.h>
int sceFiosIOFilterAdd(
    int index,
    SceFiosIOFilterCallback pFilterCallback,
    void *pFilterContext
);
```

## Arguments

|                             |  |
|-----------------------------|--|
| [in] <i>index</i>           | The index to set in the I/O filter array.                            |
| [in] <i>pFilterCallback</i> | The callback function used to implement this filter.                 |
| [in] <i>pFilterContext</i>  | A user-defined context pointer which will be passed to the callback. |

## Return Values

SCE\_FIOS\_OK for success; SCE\_FIOS\_ERROR\_BAD\_INDEX if index is already occupied, if index is less than SCE\_FIOS\_IOFILTER\_INDEX\_FIRST, or if index is greater than SCE\_FIOS\_IOFILTER\_INDEX\_LAST; or an error code that is specific to the callback.

## Description

Instantiates a new I/O filter. The index must not already be occupied. If an error occurs, the I/O filter array will not be modified.

### Arguments

---

None

### Return Values

---

Returns `true` if FIOS is idle, `false` otherwise.

### Description

---

Checks to see whether FIOS is idle. FIOS is considered idle if no I/O is being processed. FIOS may be idle even if file handles are open, as long as no I/O is scheduled for any of them. If FIOS is suspended, it is not considered idle if there is pending I/O that has been suspended.

## Description

---

Cancels an operation.

## Notes

---

This function does NOT wait for the operation to complete. If you need the op to complete, call [sceFiosOpWait\(\)](#) after cancellation. If the cancel is issued before its associated I/O completes, the op completes with `SCE_FIOS_ERROR_CANCELLED`. ```

### Arguments

---

[in] *op*    Operation to query.

### Return Values

---

Pointer to the operation's data buffer. For vector I/O such as [sceFiosFHReadv\(\)](#), the first buffer in the vector is returned.

### Description

---

Returns an operation's primary buffer.

SCE CONFIDENTIAL

---

## sceFiosOpGetError

---

Returns the error from an operation.

### Definition

---

```
#include <fios2_api.h>
int sceFiosOpGetError(
    SceFiosOp op
);
```

### Arguments

---

[in] *op*    Operation to query.

### Return Values

---

SCE\_FIOS\_ERROR\_BAD\_OP if the operation is invalid, SCE\_FIOS\_IN\_PROGRESS if the operation isn't done, otherwise the result of the asynchronous operation.

### Description

---

Returns the error from an operation.

SCE CONFIDENTIAL

---

## sceFiosOpGetOffset

---

Returns an operation's offset.

### Definition

---

```
#include <fios2_api.h>
SceFiosOffset sceFiosOpGetOffset(
    SceFiosOp op
);
```

### Arguments

---

[in] *op*    Operation to query.

### Return Values

---

Offset from the original request, or 0.

### Description

---

Returns an operation's offset.

SCE CONFIDENTIAL

---

## sceFiosOpGetPath

---

Returns an operation's path.

### Definition

---

```
#include <fios2_api.h>
const char *sceFiosOpGetPath(
    SceFiosOp op
);
```

### Arguments

---

[in] *op*    Operation to query.

### Return Values

---

Pointer to the operation's path, if any. This pointer is only valid until [sceFiosOpDelete\(\)](#) is called.

### Description

---

Returns an operation's path.

SCE CONFIDENTIAL

---

## sceFiosOpGetRequestCount

---

Returns an operation's requested size in bytes.

### Definition

---

```
#include <fios2_api.h>
SceFiosSize sceFiosOpGetRequestCount (
    SceFiosOp op
);
```

### Arguments

---

[in] *op*    Operation to query.

### Return Values

---

Number of bytes in the original request, or 0.

### Description

---

Returns an operation's requested size in bytes.

SCE CONFIDENTIAL

---

## sceFiosOpsCancelled

---

Indicates whether an operation has been cancelled.

### Definition

---

```
#include <fios2_api.h>
bool sceFiosOpIsCancelled(
    SceFiosOp op
);
```

### Arguments

---

[in] *op*    Operation to query.

### Return Values

---

Returns `true` if the operation is valid and has been cancelled, `false` otherwise.

### Description

---

Indicates whether an operation has been cancelled.

SCE CONFIDENTIAL

---

## sceFiosOpIsDone

---

Indicates whether an async operation has completed.

### Definition

---

```
#include <fios2_api.h>
bool sceFiosOpIsDone (
    SceFiosOp op
);
```

### Arguments

---

[in] *op*    Operation to query.

### Return Values

---

Returns `true` if the operation is done or is invalid, `false` if the operation is not done. For an invalid *op*, returning `true` here allows your code to continue and later check for an error value.

### Description

---

Indicates whether an async operation has completed.

SCE CONFIDENTIAL

---

# sceFiosOpReschedule

---

Reschedules an operation with a new deadline.

## Definition

---

```
#include <fios2_api.h>
void sceFiosOpReschedule (
    SceFiosOp op,
    SceFiosTime newDeadline
);
```

## Arguments

---

|                         |                          |
|-------------------------|--------------------------|
| [in] <i>op</i>          | Operation to reschedule. |
| [in] <i>newDeadline</i> | New deadline.            |

## Return Values

---

None

## Description

---

Reschedules an operation with a new deadline.

---

## sceFiosOpRescheduleWithPriority

---

Reschedules an operation with a new deadline and priority.

### Definition

---

```
#include <fios2_api.h>
void sceFiosOpRescheduleWithPriority(
    SceFiosOp op,
    SceFiosTime newDeadline,
    SceFiosPriority newPriority
);
```

### Arguments

---

|                         |                          |
|-------------------------|--------------------------|
| [in] <i>op</i>          | Operation to reschedule. |
| [in] <i>newDeadline</i> | New deadline.            |
| [in] <i>newPriority</i> | New priority.            |

### Return Values

---

None

### Description

---

Reschedules an operation with a new deadline and priority.

SCE CONFIDENTIAL

---

## sceFiosOpSyncWait

---

Waits for an operation to complete, and then deletes it.

### Definition

---

```
#include <fios2_api.h>
int sceFiosOpSyncWait(
    SceFiosOp op
);
```

### Arguments

---

[in] *op*    Operation to wait for and delete.

### Return Values

---

Result of the asynchronous operation: SCE\_FIOS\_OK for success, or an error code. For otherwise successful file reads from offsets that are at or after end-of-file, SCE\_FIOS\_ERROR\_EOF is returned, and no data is transferred; for otherwise successful file reads that transfer any data, SCE\_FIOS\_OK is returned.

### Description

---

Waits for an operation to complete, and then deletes it.

SCE CONFIDENTIAL

---

## sceFiosOpSyncWaitForIO

---

Waits for a read or write operation to complete, and then deletes it.

### Definition

---

```
#include <fios2_api.h>
SceFiosSize sceFiosOpSyncWaitForIO(
    SceFiosOp op
);
```

### Arguments

---

[in] *op*    Operation to wait for and delete.

### Return Values

---

Result of the asynchronous read or write operation. Non-negative values are the number of bytes read (including zero for read offsets at or after end-of-file);  $0 \leq \text{result} \leq$  (total number of bytes read or written). Negative values are error codes.

### Description

---

Waits for a read or write operation to complete, and then deletes it. This function is used for file sync read and write calls, and is a variant of [sceFiosOpSyncWait\(\)](#).

SCE CONFIDENTIAL

---

## sceFiosOpWait

---

Waits for an operation to complete.

### Definition

---

```
#include <fios2_api.h>
int sceFiosOpWait(
    SceFiosOp op
);
```

### Arguments

---

[in] *op*    Operation to wait for.

### Return Values

---

Result of the asynchronous operation: SCE\_FIOS\_OK for success, or an error code.

### Description

---

Waits for an operation to complete.

SCE CONFIDENTIAL

---

## sceFiosOpWaitUntil

---

Waits until a specified time for an operation to complete.

### Definition

---

```
#include <fios2_api.h>
int sceFiosOpWaitUntil(
    SceFiosOp op,
    SceFiosTime deadline
);
```

### Arguments

---

|                      |  |
|----------------------|--|
| [in] <i>op</i>       | Operation to wait for.                         |
| [in] <i>deadline</i> | Deadline at which to give up and stop waiting. |

### Return Values

---

SCE\_FIOS\_ERROR\_TIMEOUT if the deadline passes before the operation completes, otherwise the result of the asynchronous operation.

### Description

---

Waits until a specified time for an operation to complete.

SCE CONFIDENTIAL

---

# sceFiosOverlayAdd

---

Adds an overlay.

## Definition

---

```
#include <fios2_api.h>
int sceFiosOverlayAdd(
    const SceFiosOverlay *pOverlay,
    SceFiosOverlayID *pOutID
);
```

## Arguments

---

|                      |   |
|----------------------|---|
| [in] <i>pOverlay</i> | Description of the overlay to add.                        |
| [out] <i>pOutID</i>  | Filled in with the new <a href="#">SceFiosOverlayID</a> . |

## Return Values

---

SCE\_FIOS\_OK for success, or an error code.

## Description

---

Adds an overlay.

## Notes

---

You cannot create a virtual drive with an overlay. The overlay destination cannot be a drive name.

SCE CONFIDENTIAL

---

## sceFiosOverlayGetInfo

---

Gets info on an overlay.

### Definition

---

```
#include <fios2_api.h>
int sceFiosOverlayGetInfo(
    SceFiosOverlayID id,
    SceFiosOverlay *pOutOverlay
);
```

### Arguments

---

|                          |  |
|--------------------------|--|
| [in] <i>id</i>           | The <a href="#">SceFiosOverlayID</a> to query. |
| [out] <i>pOutOverlay</i> | Filled in with the overlay description.        |

### Return Values

---

SCE\_FIOS\_OK for success, or an error code.

### Description

---

Gets info on an overlay.

SCE CONFIDENTIAL

---

## sceFiosOverlayGetList

---

Gets a list of active overlays.

### Definition

---

```
#include <fios2_api.h>
int sceFiosOverlayGetList(
    SceFiosOverlayID *pOutIDs,
    size_t maxIDs,
    size_t *pActualIDs
);
```

### Arguments

---

|                         |  |
|-------------------------|--|
| [out] <i>pOutIDs</i>    | If not NULL, filled in with a list of <a href="#">SceFiosOverlayIDs</a> .                        |
| [in] <i>maxIDs</i>      | The number of <a href="#">SceFiosOverlayIDs</a> that can fit into the buffer at <i>pOutIDs</i> . |
| [out] <i>pActualIDs</i> | If not NULL, filled in with the number of active overlays.                                       |

### Return Values

---

SCE\_FIOS\_OK for success, or an error code. Note that if *pOutIDs* is NULL and *maxIDs* is non-zero, this function returns SCE\_FIOS\_ERROR\_BAD\_PTR; otherwise, it returns SCE\_FIOS\_OK.

### Description

---

Gets a list of active overlays.

SCE CONFIDENTIAL

---

# sceFiosOverlayModify

---

Modifies an overlay.

## Definition

---

```
#include <fios2_api.h>
int sceFiosOverlayModify(
    SceFiosOverlayID id,
    const SceFiosOverlay *pNewValue
);
```

## Arguments

---

|                       |   |
|-----------------------|---|
| [in] <i>id</i>        | The <a href="#">SceFiosOverlayID</a> to modify. |
| [in] <i>pNewValue</i> | New overlay description.                        |

## Return Values

---

SCE\_FIOS\_OK for success, or an error code.

## Description

---

Modifies an overlay.

SCE CONFIDENTIAL

---

## sceFiosOverlayRemove

---

Removes an overlay.

### Definition

---

```
#include <fios2_api.h>
int sceFiosOverlayRemove(
    SceFiosOverlayID id
);
```

### Arguments

---

[in] *id*      The [SceFiosOverlayID](#) to remove.

### Return Values

---

SCE\_FIOS\_OK for success, or an error code.

### Description

---

Removes an overlay.

SCE CONFIDENTIAL

# sceFiosOverlayResolveSync

Resolves a path through the active overlays.

## Definition

```
#include <fios2_api.h>
int sceFiosOverlayResolveSync(
    int resolveFlag,
    const char *pInPath,
    char *pOutPath,
    size_t maxPath
);
```

## Arguments

|                         |   |
|-------------------------|---|
| [in] <i>resolveFlag</i> | How to resolve. See <a href="#">SceFiosOverlayResolveMode</a> . |
| [in] <i>pInPath</i>     | Path before overlays are applied.                               |
| [out] <i>pOutPath</i>   | Filled in with the path after overlays are applied.             |
| [in] <i>maxPath</i>     | Size of the buffer at <i>pOutPath</i> .                         |

## Return Values

SCE\_FIOS\_OK for success, or an error code.

## Description

Resolves a path through the active overlays.

## Notes

This is a synchronous function, and it might need to issue I/O to check for a file's existence and timestamps. There is currently no asynchronous variant.

SCE CONFIDENTIAL

---

## sceFiosPathcmp

---

Compares two path strings using FIOS's active case-folding rules.

### Definition

---

```
#include <fios2_api.h>
int sceFiosPathcmp(
    const char *pA,
    const char *pB
);
```

### Arguments

---

[in] *pA*     First path to compare.  
[in] *pB*     Second path to compare.

### Return Values

---

0 if the paths are equivalent, a negative value if *pA* is lexicographically less than *pB*, positive if *pA* is lexicographically greater than *pB*.

### Description

---

Compares two path strings using FIOS's active case-folding rules.

---

## sceFiosPathncmp

---

Compares the first  $n$  characters of two path strings using FIOS's active case-folding rules.

### Definition

---

```
#include <fios2_api.h>
int sceFiosPathncmp(
    const char *pA,
    const char *pB,
    size_t n
);
```

### Arguments

---

|           |                                       |
|-----------|---------------------------------------|
| [in] $pA$ | First path to compare.                |
| [in] $pB$ | Second path to compare.               |
| [in] $n$  | Compare at most this many characters. |

### Return Values

---

0 if the paths are equivalent, negative if  $pA$  is lexicographically less than  $pB$ , positive if  $pA$  is lexicographically greater than  $pB$ .

### Description

---

Compares the first  $n$  characters of two path strings using FIOS's active case-folding rules.

SCE CONFIDENTIAL

---

## sceFiosPrintf

---

Prints a message using FIOS's output channel.

### Definition

---

```
#include <fios2_api.h>
int sceFiosPrintf(
    const char *pFormat,
    ...
);
```

### Arguments

---

|                     |                                     |
|---------------------|-------------------------------------|
| [in] <i>pFormat</i> | Format string.                      |
| [in] ...            | Additional parameters as in printf. |

### Return Values

---

Result from [sceFiosVprintf\(\)](#).

### Description

---

Prints a message using FIOS's output channel. This function simply sends its arguments to [sceFiosVprintf\(\)](#).

SCE CONFIDENTIAL

---

# sceFiosRename

---

Renames a file or directory.

## Definition

---

```
#include <fios2_api.h>
SceFiosOp sceFiosRename (
    const SceFiosOpAttr *pAttr,
    const char *pOldPath,
    const char *pNewPath
);
```

## Arguments

---

|                      |   |
|----------------------|---|
| [in] <i>pAttr</i>    | Operation attributes. May be NULL.              |
| [in] <i>pOldPath</i> | File or directory to move.                      |
| [in] <i>pNewPath</i> | New name and location of the file or directory. |

## Return Values

---

Operation handle. Caller is responsible for deleting this handle with [sceFiosOpDelete\(\)](#).

## Description

---

Renames a file or directory. This function will rename a file or directory within a logical volume, but cannot be used to copy or move files across volumes.

SCE CONFIDENTIAL

---

# sceFiosRenameSync

---

Renames a file or directory (sync).

## Definition

---

```
#include <fios2_api.h>
int sceFiosRenameSync(
    const SceFiosOpAttr *pAttr,
    const char *pOldPath,
    const char *pNewPath
);
```

## Arguments

---

|                      |   |
|----------------------|---|
| [in] <i>pAttr</i>    | Operation attributes. May be NULL.              |
| [in] <i>pOldPath</i> | File or directory to move.                      |
| [in] <i>pNewPath</i> | New name and location of the file or directory. |

## Return Values

---

SCE\_FIOS\_OK for success, or an error code.

## Description

---

Renames a file or directory (sync). This function will rename a file or directory within a logical volume, but cannot be used to copy or move files across volumes. If the *pOldPath* and *pNewPath* values are the same, this function has no effect and returns SCE\_FIOS\_OK.

SCE CONFIDENTIAL

---

## sceFiosResolve

---

Resolves a (path,offset,len) tuple through the filters.

### Definition

---

```
#include <fios2_api.h>
SceFiosOp sceFiosResolve (
    const SceFiosOpAttr *pAttr,
    const SceFiosTuple *pInTuple,
    SceFiosTuple *pOutTuple
);
```

### Arguments

---

|                        |  |
|------------------------|--|
| [in] <i>pAttr</i>      | Operation attributes. May be NULL.   |
| [in] <i>pInTuple</i>   | (Path,Offset,Length) tuple to resolve.   |
| [out] <i>pOutTuple</i> | On successful completion, filled in with the resulting (Path,Offset,Length) tuple.<br>May be the same as <i>pInTuple</i> . |

### Return Values

---

Operation handle. Caller is responsible for deleting this handle with [sceFiosOpDelete\(\)](#).

### Description

---

Resolves a (path,offset,len) tuple through the filters. This function takes overlays, archives, and other transformations into account.

SCE CONFIDENTIAL

---

## sceFiosResolveSync

---

Resolves a (path,offset,len) tuple through the filters (sync).

### Definition

---

```
#include <fios2_api.h>
int sceFiosResolveSync(
    const SceFiosOpAttr *pAttr,
    const SceFiosTuple *pInTuple,
    SceFiosTuple *pOutTuple
);
```

### Arguments

---

|                        |  |
|------------------------|--|
| [in] <i>pAttr</i>      | Operation attributes. May be NULL.   |
| [in] <i>pInTuple</i>   | (Path,Offset,Length) tuple to resolve.   |
| [out] <i>pOutTuple</i> | On successful completion, filled in with the resulting (Path,Offset,Length) tuple.<br>May be the same as <i>pInTuple</i> . |

### Return Values

---

SCE\_FIOS\_OK for success, or an error code.

### Description

---

Resolves a (path,offset,len) tuple through the filters (sync). This function takes overlays, archives, and other transformations into account.

SCE CONFIDENTIAL

---

## sceFiosResume

---

Resumes FIOS after suspension.

### Definition

---

```
#include <fios2_api.h>
void sceFiosResume ();
```

### Arguments

---

None

### Return Values

---

None

### Description

---

Resumes FIOS after suspension. This call decrements FIOS's suspend count. If the suspend count reaches zero as a result, FIOS is resumed and I/O is started immediately. If the suspend count is already zero, this call has no effect.

SCE CONFIDENTIAL

---

## sceFiosSetGlobalDefaultOpAttr

---

Sets the global default operation attributes.

### Definition

---

```
#include <fios2_api.h>
void sceFiosSetGlobalDefaultOpAttr(
    const SceFiosOpAttr *pAttr
);
```

### Arguments

---

[in] *pAttr*     New default operation attributes.

### Return Values

---

None

### Description

---

This sets default operation attributes that are used when no other attributes are specified. These global default attributes are only used when an API call is made with a `NULL` attribute pointer, and when there are no thread-local default attributes specified.

The contents of the [SceFiosOpAttr](#) struct are copied to a global inside FIOS, so it doesn't need to be persistent.

## sceFiosSetThreadDefaultOpAttr

---

Sets the thread-local default operation attributes.

### Definition

---

```
#include <fios2_api.h>
void sceFiosSetThreadDefaultOpAttr(
    const SceFiosOpAttr *pAttr
);
```

### Arguments

---

[in] *pAttr* New default operation attributes.

### Return Values

---

None

### Description

---

This sets default operation attributes which are used when no other attributes are specified. These thread-local default attributes will only be used when an API call is made with a NULL attribute pointer on the current thread.

The contents of the [SceFiosOpAttr](#) struct are copied to a thread-local variable inside FIOS.

### Notes

---

Because this function relies on thread-local storage in the compiler, it is not available on all platforms and compilers.

## sceFiosShutdownAndCancelOps

---

Shuts down FIOS and cancels any outstanding operations.

### Definition

---

```
#include <fios2_api.h>
void sceFiosShutdownAndCancelOps ();
```

### Arguments

---

None

### Return Values

---

None

### Description

---

Shuts down FIOS and cancels any outstanding operations.

SCE CONFIDENTIAL

# sceFiosStat

Returns a full set of status information for a file or directory.

## Definition

```
#include <fios2_api.h>
SceFiosOp sceFiosStat(
    const SceFiosOpAttr *pAttr,
    const char *pPath,
    SceFiosStat *pOutStatus
);
```

## Arguments

|                         |   |
|-------------------------|---|
| [in] <i>pAttr</i>       | Operation attributes. May be NULL.  |
| [in] <i>pPath</i>       | Path to query.  |
| [out] <i>pOutStatus</i> | Upon successful completion, filled in with a <a href="#">SceFiosStat</a> structure. |

## Return Values

Operation handle. Caller is responsible for deleting this handle with [sceFiosOpDelete\(\)](#).

## Description

Returns a full set of status information for a file or directory.

## Notes

Because it may require more I/O to get all of the information needed by [sceFiosStat\(\)](#), you should only use this call if you are looking for information other than size and existence.

SCE CONFIDENTIAL

---

## sceFiosStatisticsPrint

---

Prints the current FIOS statistics.

### Definition

---

```
#include <fios2_api.h>
void sceFiosStatisticsPrint();
```

### Arguments

---

None

### Return Values

---

None

### Description

---

Prints the current FIOS statistics.

## sceFiosStatisticsReset

---

Resets FIOS statistics.

### Definition

---

```
#include <fios2_api.h>
void sceFiosStatisticsReset();
```

### Arguments

---

None

### Return Values

---

None

### Description

---

Resets the FIOS statistics to initial values.

SCE CONFIDENTIAL

# sceFiosStatSync

Returns a full set of status information for a file or directory (sync).

## Definition

```
#include <fios2_api.h>
int sceFiosStatSync(
    const SceFiosOpAttr *pAttr,
    const char *pPath,
    SceFiosStat *pOutStatus
);
```

## Arguments

|                         |   |
|-------------------------|---|
| [in] <i>pAttr</i>       | Operation attributes. May be NULL.  |
| [out] <i>pPath</i>      | Path to query.  |
| [out] <i>pOutStatus</i> | Upon successful completion, filled in with a <a href="#">SceFiosStat</a> structure. |

## Return Values

SCE\_FIOS\_OK for success, or an error code.

## Description

Returns a full set of status information for a file or directory (sync).

## Notes

Because it may require more I/O to get all of the information needed by [sceFiosStatSync\(\)](#), you should only use this call if you are looking for information other than size and existence.

SCE CONFIDENTIAL

## sceFiosSuspend

---

Temporarily suspends FIOS.

### Definition

---

```
#include <fios2_api.h>
void sceFiosSuspend ();
```

### Arguments

---

None

### Return Values

---

None

### Description

---

Temporarily suspends FIOS. FIOS may be suspended to temporarily stop all I/O. This call increments FIOS's suspend count; while the suspend count is non-zero, FIOS is suspended. New I/O requests will be accepted while FIOS is suspended, but they will not be processed until the suspend count reaches zero.

SCE CONFIDENTIAL

| [in] <i>flag</i>  | Device-specific flags.             |

## Return Values

---

Operation handle. Caller is responsible for deleting this handle with [sceFiosOpDelete\(\)](#).

## Description

---

Flushes changes to a device. Available only on PlayStation®Vita.

This function might fail if the underlying media doesn't support the sync command. For example, an error may be returned for filesystems on the network.

| [in] <i>flag</i>  | Device-specific flags. If unknown, use zero. |

## Return Values

---

SCE\_FIOS\_OK for success, or an error code.

## Description

---

Flushes changes to a device (sync). Available only on PlayStation®Vita.

This function might fail if the underlying media doesn't support the sync command. For example, an error may be returned for filesystems on the network.

# sceFiosTerminate

---

Terminates FIOS.

## Definition

---

```
#include <fios2_api.h>
void sceFiosTerminate ();
```

## Arguments

---

None

## Return Values

---

None

## Description

---

Terminates FIOS. This call also closes currently open files. This call is not normally necessary. However, it might be helpful if you are planning on fully unloading FIOS from memory.

### Arguments

---

None

### Return Values

---

The current time.

### Description

---

Gets the current time.

SCEI CONFIDENTIAL

### Definition

---

```
#include <fios2_api.h>
SceFiosTimeInterval sceFiosTimeIntervalFromNanoseconds (
    int64_t ns
);
```

### Arguments

---

[in] *ns*     Nanoseconds to convert.

### Return Values

---

The equivalent [SceFiosTimeInterval](#).

### Description

---

Converts nanoseconds to a [SceFiosTimeInterval](#).

SCEI CONFIDENTIAL

---

## sceFiosTimeIntervalToNanoseconds

---

Converts a [SceFiosTimeInterval](#) to nanoseconds.

### Definition

---

```
#include <fios2_api.h>
int64_t sceFiosTimeIntervalToNanoseconds (
    SceFiosTimeInterval interval
);
```

### Arguments

---

[in] *interval* Interval to convert.

### Return Values

---

The equivalent number of nanoseconds.

### Description

---

Converts a [SceFiosTimeInterval](#) to nanoseconds.

### Notes

---

The result is rounded upward, so an interval representing 1.5 nanoseconds will return the value 2.

SCEI CONFIDENTIAL

## sceFiosUpdateParameters

---

Updates the active FIOS parameters.

### Definition

---

```
#include <fios2_api.h>
void sceFiosUpdateParameters (
    const SceFiosParams *pParameters
);
```

### Arguments

---

[in] *pParameters*      New parameters.

### Return Values

---

None

### Description

---

Updates the active FIOS parameters.

### Notes

---

You can only update *profiling*, *maxChunk*, and *pvprintf*. The other startup parameters, such as the buffers that you passed during initialization, cannot be changed.

SCE CONFIDENTIAL

---

## sceFiosVprintf

---

Prints a message using FIOS's output channel.

### Definition

---

```
#include <fios2_api.h>
int sceFiosVprintf(
    const char *pFormat,
    va_list ap
);
```

### Arguments

---

|                     |  |
|---------------------|--|
| [in] <i>pFormat</i> | Format string.                                     |
| [in] <i>ap</i>      | Additional parameters as in <code>vprintf</code> . |

### Return Values

---

Result from *pVprintf* or `vprintf`.

### Description

---

Prints a message using FIOS's output channel. This function will use the callback from [SceFiosParams](#).*pVprintf*, or the system standard `vprintf` if no callback is supplied.

```
#include <fios2_types.h>
typedef void * (*SceFiosMemcpyCallback) (
    void *dst,
    const void *src,
    size_t len

```

## Arguments

---

|            |   |
|------------|---|
| <i>dst</i> | Destination buffer. Never overlaps the source buffer. |
| <i>src</i> | Source buffer. Never overlaps the destination buffer. |
| <i>len</i> | Number of bytes to copy. Always at least 4KiB.        |

## Return Values

---

The return value is always ignored by FIOS and is provided only for compatibility with the standard prototype for `memcpy`.

## Description

---

Callback used for large memcpy operations.

# SceFiosOpCallback

Callback made when an operation completes or is deleted.

## Definition

```
#include <fios2_types.h>
typedef int (*SceFiosOpCallback) (
    void *pContext,
    SceFiosOp op,
    SceFiosOpEvent event,
    int err
);
```

## Arguments

|                 |  |
|-----------------|--|
| <i>pContext</i> | User-specified context pointer.  |
| <i>op</i>       | Operation that generated this event.   |
| <i>event</i>    | Event type.  |
| <i>err</i>      | Error from the operation, as returned by <a href="#">sceFiosOpGetError()</a> . |

## Return Values

Returns `SCE_FIOS_OK` if the event was handled.

## Description

Callback made when an operation completes or is deleted. This callback should be quick and not run for any significant length of time (either processing data or waiting for another operation). Doing so may delay other I/O requests.

You may delete the incoming operation as part of handling a completion event, but be aware that this causes your callback to be re-entered with a deletion event.

## Notes

For asynchronous calls (such as `sceFiosFHOpen`), a callback can be called before the asynchronous call returns. A callback can be called from the caller's thread or from a FIOS2 thread.

---

Callback used for profiling.

## Definition

---

```
#include <fios2_types.h>
typedef void (*SceFiosProfileCallback) (
    const SceFiosProfilingEvent *event
);
```

## Arguments

---

*event*     The generic event data structure passed to the profile callback.

## Return Values

---

None

## Description

---

Callback used for profiling. This function is called when one of the [SceFiosProfilingEventType](#) events completes; when called, the `endTime` of the event should be very close to the current time.

This callback can be called from the FIOS threads, so there might be a limited amount of stack space.

This callback should be fast and not run for any significant length of time, otherwise I/O could be significantly impacted.

| SCE_FIOS_IO_THREAD_COUNT_MAX | 2     | The maximum number of I/O threads allowed.<br>Applies to PlayStation®Vita only. |

## Description

The number of I/O schedulers.

## Notes

For all platforms, if the thread count is 1, all I/O executes on one thread. For each *ioThreadCount*, there is an associated scheduler queue, and for each queue, there are *threadsPerScheduler* threads. For PlayStation®Vita, if the thread count is 2, thread 1 is used for host I/O, and thread 0 is used for everything else. For Windows, one thread is used for all I/O.

## Enumeration Values

| Macro                             | Value  | Description   |
|-----------------------------------|--------|---|
| SCE_FIOS_OPFLAG_IMMED             | (1<<0) | Set to allow synchronous open, close, or stat related API calls to be immediately executed on the caller's thread, rather than being enqueued for possible execution later. This flag is useful when there are many ops in-flight, and an open or stat call must happen as soon as possible. It is also useful when you know that the ops should be nearly immediate. Note that for a close call, if any ops are using the file handle passed to the close, the close is enqueued for execution after dependent ops have completed (and thus does not run immediately). |
| SCE_FIOS_OPFLAG_DONTUSECACHE      | (1<<1) | Ignore cache-hits when executing this operation.  |
| SCE_FIOS_OPFLAG_DONTFILLRAMCACHE  | (1<<2) | Don't cache-fill to any RAM-based caches.   |
| SCE_FIOS_OPFLAG_DONTFILLDISKCACHE | (1<<3) | Don't cache-fill to any disk-based caches. This flag only applies to systems which have a disk cache.   |

| SCE_FIOS_OPFLAG_UNCACHEDBUFFER | (1<<5)   | Buffers for this I/O are in uncached memory such as VRAM.                                     |
