1 Overview

Purpose

This document explains the handling of error codes in PlayStation®Vita. A system in which hexadecimal error codes are paired with short error codes is adopted in PlayStation®Vita. The short error codes are used to notify end users about the error contents.

Error Code System

Error codes are organized as negative values expressed in the hexadecimal notation, each paired with a short error code. The error codes returned by the libraries or the system software are hexadecimal error codes. On the other hand, the error codes to be shown to the end users are short error codes based on the error code table controlled by the system software. The short error codes are defined with character strings.

The short error codes are provided to make the notification of error contents to end users easier to understand. For application development, use hexadecimal error codes.

Macro	Hexadecimal Error Code	Short Error Code
SCE_NET_ERROR_ECONNREFUSED	8041013d	NW-2465-7

Handling of Errors

In principle, applications are required to recover from errors that occur. However, in the case of errors that are not recoverable or errors that are difficult to recover, applications are required to notify the end users of the situation with an error code according to the contents prescribed by the TRC (Technical Requirements Checklist), and terminate.

In PlayStation®Vita, error notification to the end users is performed through Message Dialog. By handing the hexadecimal error code of the error that occurred to Message Dialog API, an appropriate phrase paired to the hexadecimal error code is selected and a short error code is displayed. For details on Message Dialog, refer to the "Message Dialog Overview" document.

Short Error Code

The short error code system is determined for each SDK. Once a code system has been determined, it continues to be used for successive SDK versions. Therefore, past short error codes remain unchanged even when error codes are added or changed.

Format

The format of short error codes is as follows. Each short error code is made up of up to 10 characters, not including the termination character.

Short Error Code	Facility Group	Short Error Number
NW-2465-7	NW	2465-7

The facility group consists of 2 characters, such as C0 or C1. The short error number, which consists of up to 5 digits + 1 digit, is a unique number for the entire system. As an exception, error codes that are not allocated short error number use the following format.

| Short Error Code	Facility Group	Hexadecimal Error Code
E-80000000	E	80000000

2 PSP2 Error Code Viewer

A tool "PSP2 Error Code Viewer" is provided for an efficient search of short error codes displayed through Message Dialog, etc. or hexadecimal error codes returned by the libraries.

Overview

PSP2 Error Code Viewer is released as the following file.

- %SCE_PSP2_SDK_DIR%\host_tools\bin\psp2_error_code_viewer.exe

Upon executing the above program PSP2 Error Code Viewer will start up.

Usage Method

By inputting arbitrary character strings in the text box "Search", short error codes, hexadecimal error codes and macro names corresponding to the input character strings will be listed below. Incremental search is automatically performed according to the character strings input in the "Search" box. If two words are input ("common configured", for example), the words corresponding to the two words (in this example, SCE_COMMON_DIALOG_ERROR_NOT_CONFIGURED) will be displayed.

In addition, by checking the "Use Regular Expression Search" checkbox, regular expressions can also be used. The grammar of regular expression complies with the following.

- https://msdn.microsoft.com/en-us/library/az24scfc.aspx
  (The above reference destination has been confirmed as of March 4, 2015. Note that pages may have been subsequently moved or its contents modified.)

If inputting "kernel.*(flags|argument)", for example, the error codes that correspond to a kernel error and that are followed by a character string containing 'flags' or 'argument' will be displayed.

3 Error Code List

Overview

Hexadecimal error code and short error code correspond one to one. For details about the error codes, refer to the each relevant document.

List

The error code list is as follows.
A list of the error codes in the form of a CSV file is available at the following location:
`%SCE_PSP2_SDK_DIR%\host_tools\debugging\error_code\error_table.csv`

Short Error Code	Hexadecimal Error Code	Macro
C2-2000-2	0x80100600	SCE_APPUTIL_ERROR_PARAMETER
